

The quality of the UI the AI can provide

The quality that the AI can produce about the UI interface was good, especially with the first phase of the project. The AI generated a clean, ordered and functional design, with clear buttons, fields, and labels. It wasn't a perfect design but it was a good at the starting for representing a visual idea without having to create everything from the beginning. The only problem is it needs manual adjustments and specific details to be as good as planned.

The experience of producing UI with an AI tool

The experience was simple, easy and quick. I just had to describe what I wanted in a simply way and the AI tool automatically generated the interface. The platform was intuitive and allowed me to move the elements or modifying text without complications. The best attribute of the tool it's that you don't need to be a designer to use it or to have a specific idea of the theme or problem. It was definitely a tool very easy to use.

How to include the usability attribute

The good thing of working with AI tool is the tool included some usability attributes without asking for it specifically. For example, it had a visual clarity, visible buttons and a simple navigation flow. That help the user to easily understand what to do. It also maintained good color, contrasts and visual hierarchy. But, as expected, the need of manual details were visible, such as field validation, error messages, and full accessibility. In conclusion, it can not be used directly without doing some improvements.

Will the UX role change significantly with the development of AI tools?

Yes, obviously the role of the UX designer will change with the use of AI tools but it won't disappear. Now, the designer will have to be using the AI and focus on improving and adjusting what AI produces. The job or the role will include the help of the AI, or the smart enterprises will include it to improve in every area. However, it will continue to be key to researching users, understanding their needs and ensuring that the solution is the most useful, accessible and preferred. The AI helps but can replace the designers, actually the AI needs the manual detail and analysis from a real person, for now.
