

UI Design Patterns

During the design of the prototype, we identified multiple critical tasks associated with the workflow of therapists and administrative staff. One of these tasks was the structured visualization of the patient's clinical record, which had to meet the requirements of clarity, navigability, and privacy protection.

To address this need, we applied the “Accordion” design pattern — a UI design pattern intended to display large volumes of hierarchical data in a compact and progressive way. This pattern allows users to expand or collapse relevant sections according to their needs.

The selection of this pattern was guided by user-centered design principles derived from the Personas method, through which we identified that therapists require quick and segmented access to information.

From my perspective, this experience allowed me to recognize that interface design goes beyond aesthetics; it is a strategic tool that can either facilitate or hinder clinical work. Applying a design pattern was not merely an aesthetic decision, but a way to respond empathetically to the real needs of users.
