

Using Personas

In the first stage of the analysis, through the technique of personas, we collect relevant data about the needs, objectives and behaviors of the therapists, and this information help us to understand the users and to make important decisions in the UI and the prototype, assuring that the interfaces not only respond to suppositions but real requirements of use.

An specific example of this application was the adaptation of the screen to the characteristics of the main persona “Alejandra, therapist in formation”, and between the findings we can see that she have:

1. Limited time to register evaluations
2. High priority in the clarity and simplicity of information
3. Need of receive immediate feedback

So in base to that we make this:

1. In the UI, we design a form of evaluation with the fields by group
2. Reduce the obligatory fields
3. Implement visual alerts every time the save was successfully done

The use of personas improve the experience of the final user and it work more than just cover functional needs, so in this way, every element has a purpose and its align with the user's profile and his context.
